JAN-9201/7201
ECDIS

- Provide a smooth operating environment ensured by high-speed chart drawing.

- Conforming to the latest IMO performance standards with Marine Equipment Directive (MED) certification.
- Ensuring intuitive and easy-to-use display and operation performance reflecting professional user’s voices.
- Integrating route editing and route safety checking to support safer route plans.
- Delivered with a software license allowing an expansion tailored to each operational requirement for a wide variety of optional features.
- ECDIS type-specific training (TST) is provided by a variety of organizations around the world on behalf of JRC.

* The photograph includes options.
ECDIS

The Electronic Chart Display and Information System (ECDIS) is a geographic information system for voyage planning and route monitoring to support the safety navigation of ships at sea. The ECDIS onboard a ship uses images obtained from the automatic identification system (AIS), radar system, and collision avoidance target tracking (TT) system and superposes the images with navigational chart information, thus accurately displaying dynamic information on other ships around. Also the ECDIS plays central roles in the safe navigation of the ship and provides safety functions, including the generation of warnings when the ship approaches dangerous areas. The ECDIS is useful for marine accident avoidance and serves as equipment indispensable to the safe navigation of ships.

Mandatory installation of ECDIS

In response to the latest revision of the International Convention for the Safety of Life at Sea (SOLAS), the International Maritime Organization (IMO) enforced the mandatory installation of the ECDIS on oceangoing passenger ships with 500 gross tons or more and tankers and cargo ships with 3,000 gross tons or more in a stepwise manner in and after July 2012. This mandatory decision requires conventional paper charts or an additional ECDIS as a backup to the primary ECDIS if a ship uses the primary ECDIS as main navigational equipment. (Requirements for the equipment and operation qualification are subject to approval from the country with which the ship is registered and recommendations from the classification society of the ship.)

Regulations and major specifications

This equipment conforms to the requirements set out in the IMO’s resolution MSC.191 (79) for display-related voyage information adopted in December 2004 and the IMO Resolution MSC.232 (82) for ECDIS performance standards adopted in December 2006. Other specifications of the ECDIS are shown below.

- Electronic chart display function/Radar overlay function: IEC 61174
- Display-related voyage information: IEC 62288
- Track control system (TCS) function*1: IEC 62065

*1. Contact your JRC representative for supporting autopilot models.
JAN-9201/7201

Features

Sophisticated user interface

The JAN-9201/7201 incorporates a new user interface (named jGUI) for an intuitive, easy-to-use, simple menu system based on the display of icons. This interface always displays critical data in fixed positions on the screen while icon-based menu display informs users of corresponding functions straightaway. Furthermore, target tracking (TT) and AIS symbols feature pop-up displays while mouseover on the target showing their main data at a glance.

Easy-to-use operating unit

The newly designed trackball supports all the operation of the equipment. Users will be alerted with alarms from the operating unit and color changes under situations that require attention.

Optional keyboard

The ECDIS will be operable like conventional models by connecting an optional operating unit that incorporates dedicated function buttons, control knobs and a full keyboard.

Route editing and safety checking

JRC’s new ECDIS model JAN 9201/7201 has integrated route editing, which was conventionally divided into two segments, i.e., graphics input and numeric table input areas, into one. Waypoints, if specified, on a navigational chart are immediately quantified and added to the numeric editing table, and the numeric data on the waypoints that is input into the editing table is immediately reflected on the navigational chart. Up to four routes can be edited at the same time, and a portion cut out of any route can be combined and the routes can be all or partly replaced or edited. Furthermore, a safety check on edited route data is possible with a click of a button. Detected error information items, if any, are listed and displayed, and the corresponding route portions are highlighted in the chart and table, which can be confirmed at a glance to take remedial measures.
JAN-9201/7201
Functional expansion and configuration

Functional expansion

The equipment incorporates a variety of optional functions that will be available with software licenses added. Software licenses can be added before or after the radar comes into operation. Therefore, the radar can be customized to match the actual operating conditions.

Optional functions

- Expansion of AIS display targets (500 → 1000)
- Radar overlay function*1
- TCS support*2
- S-Joy control support*3

*1. The radar overlay function requires an optional radar interface circuit and radar image signal input.
*2. The track control system (TCS) function requires auto pilot connections in addition. For details, including corresponding models, contact your JRC representative.
*3. For autopilot models connectable to the S-Joy control panel, contact your JRC representative.

Correspond to the major chart

The JAN-9201/7201 supports the display of major electronic navigational charts (ENCs), including those provided by ADMIRALTY Vector Chart Service (AVCS) (S-57 Ed 3.0/3.1 and S-63), NAVTOR ENC Service, and C-MAP ADMIRALTY ENC Service as well as ADMIRALTY Raster Chart Service (ARCS). Also, it supports advanced features provided with ENCs, such as the Admiralty Information Overlay (AIO) of AVCS by the United Kingdom Hydrographic Office (UKHO) and Dynamic Licensing of Jeppesen ENC service.

ENC (S-57 and S-63 vector charts)
- AVCS (AIO supported)
- NAVTOR ENC Service (PAYS supported)
- C-MAP ADMIRALTY ENC Service*4 (Dynamic Licensing supported)

Raster charts
- ARCS

Others (private charts)
- C-MAP Professional+*4

*4. eToken is optional item.

Satellite transmission blocking area display*5

The equipment offers a function for confirming areas where JRC INMARSAT FBB and INMARSAT GX*6 equipment cannot communicate with satellites. The equipment can display satellite antenna reception levels, blocking conditions, and transmission suspension*7. When connections with antennas are lost, this function can be used to check whether it is a temporary transmission outage or it is caused by a device malfunction. When performing route planning, this function makes it possible to confirm in advance if there are any parts of the route where satellite communication is not possible and to avoid losing contact.

*5. Satellite transmission blocking area display is optional. Contact your JRC representative.
*6. The INMARSAT FBB and INMARSAT GX support the JUE-251/501 and the JUE-60GX.
*7. Transmission suspension supports only the JUE-60GX.
JAN-9201/7201  
Functional expansion and configuration

**VHF remote operation by ECDIS**

The ECDIS offers a VHF remote operation function*. This can be used to configure channels on the VHF unit or to perform DSC calls using AIS targets on the radar PPI screen. Features such as the wireless speaker mic* make it possible to communicate with other ships even when away from the VHF equipment.

![Example of ECDIS JAN-9201 26-inch display](Image)

*8. The VHF supports the JHS-800S.  
*9. Wireless speaker mic is option for the JHS-800S.

**Sensor data sharing**

The central control unit is provided with the only minimum required external interfaces specified by Marine Equipment Directives (MEDs), and other sensor data is received through the bridge network (LAN) from the interface circuits. The interface circuits are designed to be shared by a number of new-type navigation devices, and each type of interface circuit can be combined and selected according to each signal format and the number of connections.

![Interface circuit arrangement in NQE-1143 junction box](Image)

**Interface circuits**

- S : SLC (Serial LAN interface circuit): IEC 61162-2 × 2; IEC 61162-1 × 8; Contact input point × 4; Contact output point × 8
- A : AOC (Analog option circuit)*10: -10 to 10VDC or 4 to 20mA × 4
- G : GIF (Gyro interface circuit): Gyro signals (Sync and Step); Ship speed pulse signals (100 to 800 pp)
- R : RIF (Radar interface circuit): Interswitch connection × 1; Slave video input × 1

*10. The installation of the AOC requires a serial LAN interface circuit (SLC).
Type-specific training (TST)

Unlike JRC’s conventional ECDIS models, this ECDIS has adopted a new operation system and a TST program supporting the new operation system is required. The TST for the new ECDIS is given at JRC’s major branches, agents, and training institutions around the world. The training will be given onboard or offices by instructors dispatched at the request of customers. Furthermore, PC software is available for users’ self-learning at home or onboard. For more information about TST, contact your JRC representative.
